

ABSTRACT

An image forming apparatus management system for setting various parameters of the image forming apparatus according to a job instruction from the client machine 2 comprises a host server 4 equipped with an external database 5 for storing various parameters of the image forming apparatus 1 corresponding to the predetermined job conditions, said host server retrieving various parameters satisfying the job conditions from the external database 5 according to the external parameter request and delivering the parameters, and a client server 3 connected to said host server 4 in a bidirectionally communicable way, said client server associated with communications between said client machine 2 and the image forming apparatus 1 and making an external parameter request to the host server 4 as well as supplying various parameters delivered from the host server 4 to the image forming apparatus 1.
